

# Key Characteristics

## Intuitive, Easy-to-use Self-Service Interface

Ensures users can quickly access information and complete tasks with little or no training. Clear on-screen help and "how to" explanations provide all the assistance that's needed.

## Role-Based, Advanced Security Features

Easy security administration and provisions for the higher levels of granularity required for enterprise-wide use. As different users have different roles and levels of access rights to the program, the system automatically presents each user with the appropriate interface and data according to their roles and positions.

## Web Native

Designed from the ground up as a web application, rather than an adaptation of an existing client/server application. Web native means two things: no legacy 'baggage'; and access & connection from anywhere in the world through the Internet. Authorized users can carry out important tasks even when traveling and there is a constant connection between all branches and the Head Office.

## Designed for Enterprise-wide Deployment

Offers easy deployment and lower maintenance costs, since all software code is installed centrally on the server(s). The full system functionality is accessible from anywhere.

## Integrated Workflow Engine

Streamlines administrative processes, increasing productivity and improving service delivery by automatically routing tasks and managing information flow.

## Centralized Data and Process Management

Ensures a shared view of information, avoids data duplication and improves business efficiency.

## Automatic Alerts

Highlights issues if key performance indicators are exceeded. Email notification is also sent to authorized personnel to inform them of critical issues that need to be addressed.

## Integration & Compatibility

Compatible with popular databases, e.g. MS SQL Server, Oracle; operating systems such as Windows 2000 or 2003, Vista, Red Hat Linux and Sun Solaris; and Internet browsers, e.g. MS IE, Firefox. Can be easily integrated with other SunFish products such as HR as well as 3rd party applications.

## Adaptability

Equipped with multi-language and multi-currency feature. Available languages are: English, Indonesian, Chinese and German. Available currencies are: US Dollar, Indonesian Rupiah, Singapore Dollar, Euros, or other currencies as defined. These features make the system highly adaptable and able to be operated in different countries.

## Suitable for Indonesia

Designed specifically for Indonesian corporations as all modules meet Indonesian tax laws and regulations. With its adaptability, SunFish can be deployed in multiple offices around Indonesia, and even around the world with almost no constraints.

## Customizable

Customizable to meet the unique requirements of different corporations. Using Macromedia Coldfusion MX™ as the programming language, additional modules can be flexibly added if needed, so that SunFish meets an organization's unique structure or business requirements.
